## Beyfortus (Nirsevimab) Waiver

### *RSV Antibody Injection*

RSV (respiratory syncytial virus) is a common virus in infants and children. Severe forms of this virus can result in more serious illnesses including the need for hospitalizations. Beyfortus is a monoclonal antibody injection that offers protection against RSV through the season (approximately 5 months). It is recommended by the American Academy of Pediatrics as well as the CDC for all infants under the age of 8 months and some children 8-19 months at higher risk for severe illness.

Due to the high cost of purchasing this antibody injection, coupled with insurance company reimbursement uncertainties, Physicians to Children will be requiring a **payment of \$500 in advance** for this immunization. This deposit will cover the costs associated with it in the event that insurances choose to deny payment. We will refund this cost directly back to you if your insurance company covers the cost of the injection (less any outstanding patient balances).

If you have questions regarding the immunization, please ask your healthcare provider and we would be happy to discuss the risks and benefits. We appreciate your understanding as we navigate this new process while attempting to provide the best possible care for our patients.

By signing below, we acknowledge that we have read and understood the terms of this Agreement and agree to be bound by them.
